^{*}The Quarterly Morbidity Report lists the diseases that are reportable according to the New York State law. Cases are reported by the month of diagnosis if available. If not, a report date is assigned to the case by first symptom date, date reported to the Health Department, date when a supplemental file was created, or date when the Health Department received the record. Diseases with no cases reported for two years prior, are not included. Some disease categories may include probable cases.

- 1.As of January 2009, "other meningitis/bacteremias" do not include meningitis caused by Haemophilus influenzae Type B, Group A Strep, Group B Strep or Strep Pneumo
- 2. Beginning in January 2000, Invasive Strep Pneumoniae includes Invasive Strep Pneumoniae (Sensitive), Bacteremia and Meningitis. In prior years, only Pneumococcal Meningitis was reportable.
- 3. Shiga toxin producing E. Coli (STEC); may include non-0157 shiga toxin producing strains of E. Coli.
- 4. Some Hemolytic Uremic Syndrome cases are also reported as STEC (E. coli 0157).
- 5. Chronic Hepatitis B and C became reportable in NYS in June 2002.
- 6. Incomplete data due to surveillance limitations.
- Total Chlamydia cases do not include LGV.
- 8. Total syphilis cases do not include congenital syphilis.
- 9. Lyme disease totals includes number of confirmed cases from sentinel surveillance, erythema migrans (EM) rash and provider reporting. Sentinel surveillance randomly extracts 20% of cases reported to WCDOH through the Electronic Clinical Laboratory Reporting System (ECLRS)
- 10. The number of individuals to whom rabies post-exposure prophylaxis has been distributed.
- 11. Some Toxic Shock Syndrome cases are also reported as Group A Strep and Group B Strep

Comments from the Division of Disease Control

Overview:

- · Changes for a single reporting period must generally be further monitored to assess significance.
- · When numbers are low, minor variations can appear significant.
- · The incidence of most diseases fluctuate naturally and are often temporally clustered without necessarily having any significance.

Highlights:

Chronic Hepatitis - The reduction in the number of cases noted for 2009 and 2010 compared with 2008 is due to decreased capacity for investigation and data entry of case reports beginning in 2009, with priority given to surveillance of acute cases.

Lyme: The number of case reports received for investigation and confirmed Lyme cases during 2010 are decreased compared with 2008 and 2009. NYSDOH has observed a statewide decrease in Lyme disease in 2010; this is consistent with NYSDOH tick surveillance information that there were very few nymphal ticks (the primary vector for Lyme disease) earlier in the year.

Pertussis – An increased incidence was noted during the 4nd quarter and for all of 2010 compared to the previous 2 years. A number of states, including NYS, have reported an increase in cases during 2010. This increase likely represents the natural periodic increase in disease observed every 3-5 years since the early 1980s. The last significant peak in pertussis cases was observed in 2004 (81 cases).

Salmonella – Compared with previous years, the number of cases for the first 3 quarters was increased, but was not significantly increased during the 4th quarter. This resulted in a cumulative increase in the annual number of cases. The increase in cases during 2010 is not being observed elsewhere in the metropolitan region. This may represent natural fluctuations in disease incidence and will continue to be monitored.

Gonorrhea - The increase in cases during 2010 also is being observed in NYC and certain upstate areas, but not other counties in the metropolitan region. This may represent natural fluctuations in disease incidence and will continue to be monitored.

Chlamydia – An increase in incidence was noted during the 3nd quarter which accounts for the year to date 2010 increase compared to the previous 2 years. This may represent natural fluctuation in disease incidence and will continue to be monitored.
